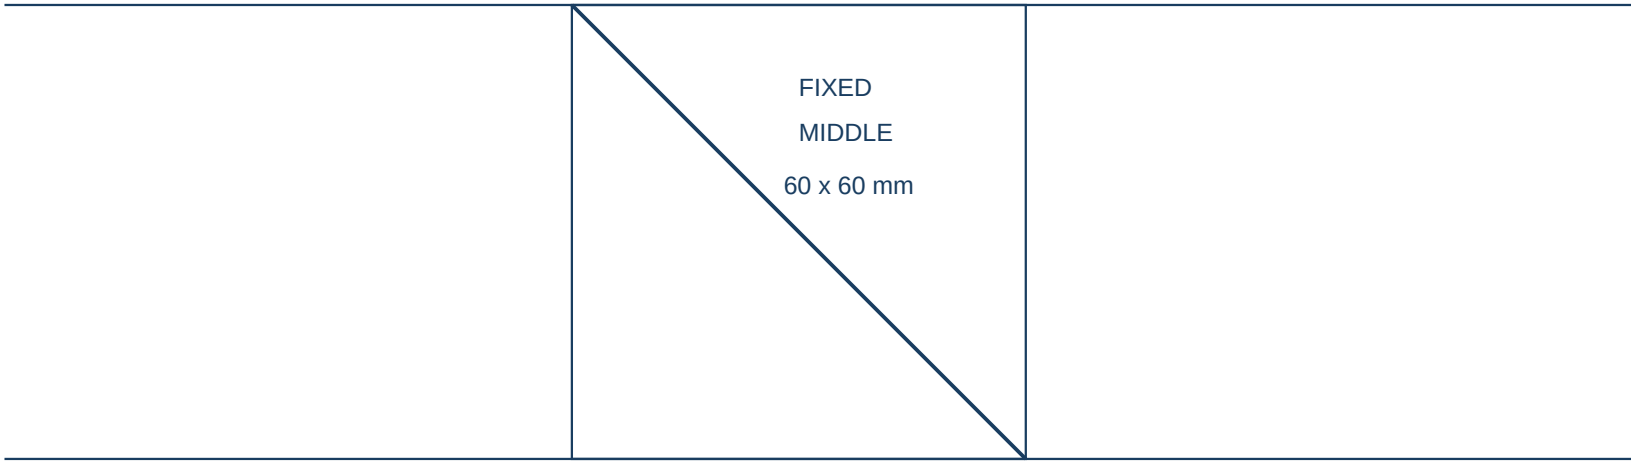
STOICHEIA / SLIDING PLATES / VOLUME FACTOR 2

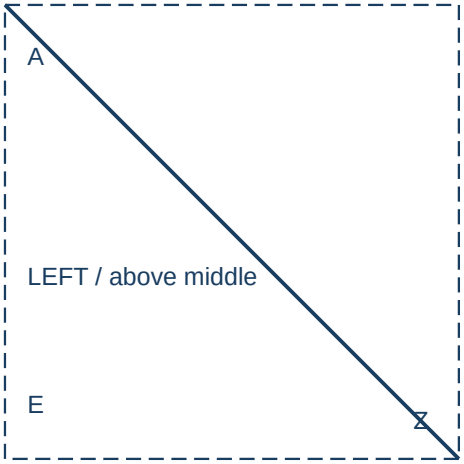
A modern paper exploration of the construction transmitted by Eutocius, Heiberg 1881, pp.106-113.

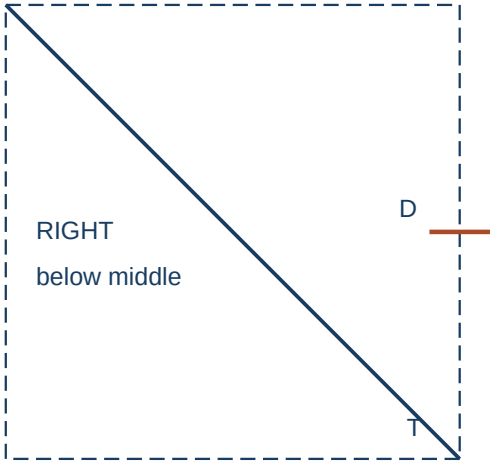


Hold both moving panels between the guides. All diagonals slope the same way.

Align a straightedge from A through both exposed contacts B, G to D. Read G's height above the lower guide.

For an original edge of 1 unit, divide that height by 30 mm. Cube this ratio to check the volume.





Cut dashed outlines only. Make a slit at the middle panel's upper and lower edges if needed to pass the right panel below it.

Print at 100%, without fit-to-page. This is not a groove fabrication plan; physical assembly and accuracy are unverified.
